Appendix 2: Nutrients (DQX)

Appendix 2: Nutrients (DQX)

Nutrient variables were calculated by multiplying the frequency* for each line item by a nutrient amount which was dependent on the gender of the subject as well as the response to serving size, when applicable.

These nutrient amounts came from databases based on national dietary data (USDA's 1994-96 Continuing Survey of Food Intakes by Individuals [CSFII], available from the USDA Food Surveys Research Group, or the Nutrition Data Systems for Research (NDS-R) from the University of Minnesota, which has nutrient values not available from the USDA Survey Nutrient Database), containing one record per line item, gender, and serving size (small, medium, large, or overall). Unless specified, all nutrients were derived using CSFII.

Variables have been created for protein from animal, plant, and dairy sources, as well as animal + dairy. The values were derived based on spreadsheets provided by NCI investigators indicating what percentage of the protein from each line item on the questionnaire should be applied to each group. For example, 65% of the protein from "chili with beans" was applied to the "animal" group, while 35% was applied to the "plant" group.

*NOTE: weekly frequencies were multiplied by a number of weeks according to the seasonality of the line item to obtain a yearly frequency. After multiplying by the nutrient amount, the result was then converted back to a daily amount by dividing by 365.25. The multipliers were as follows:

"In season" line items: 13 weeks

"Out of season" line items: 39 weeks

All other line items: 52 weeks

Appendix 3: Supplements (DQX)

Appendix 3: Supplements (DQX)

Daily supplement amounts were calculated from single and/or multi-vitamins based on the responses to the supplement questions on page 14 and 15 of the DQX. Values for multivitamins were derived from the NHANES III database.

Two versions of supplement variables were created. Variables ending with "_now" were made only for supplements being taken at the time the DQX was completed. The other version includes supplements being taken at the time the DQX was completed and those being taken 2 years ago.

Servings and serving sizes for soda (non-diet), coffee (regular or decaf) and tea (hot or iced) were asked on page 11. The variables that have been derived from these questions are listed below according to the section where they can be found in the data dictionary.

Appendix 5: Flavonoids

Appendix 5: Flavonoids

Flavonoid and isoflavonoid variables are all mg/day. These flavonoid variables are “50%” variables, meaning that, for the purpose of deriving the nutrient database values, amounts for processed foods were assumed to be 50% of the raw food or foods. This was done to account for flavonoid losses due to processing.

See Appendix: Nutrients (DHQ) for more details regarding the calculations.

Appendix 6: Glycemic Index and Glycemic Load (DQX)

Appendix 6: Glycemic Index and Glycemic Load (DQX)

Glycemic load is defined as the grams of available carbohydrate in the food multiplied by the food's glycemic index / 100. The glycemic load was calculated in the same way as other nutrients, that is, the nutrient database contained an amount for each line item based on gender and serving size where applicable. This amount was multiplied by the frequency with which the subject reported consuming the item, and the glycemic load for all items was added together and converted to a total daily value. See Appendix: Nutrients (DQX) for more details.

The glycemic index for each subject was calculated as a weighted average of the foods they ate by multiplying the subject's daily glycemic load by 100 and dividing by their daily "available" carbohydrate consumption. Available carbohydrates were defined as total carbohydrates – total dietary fiber (dt_fiber_csfii (DQX) was used for this purpose).

Appendix 7: Pyramid (DQX)

Appendix 7: Pyramid (DQX)

Pyramid serving variables were calculated in the same manner as the nutrient variables using amounts based on the U.S. Department of Agriculture's pyramid servings. These variables represent standardized servings of food groups from all sources, or (in the case of p_tomatofr) from specific sources.

See Appendix: Nutrients (DQX)

Appendix 8: MPED (DQX)

Appendix 8: MPED (DQX)

MPED (My Pyramid Equivalents Database) variables were calculated in the same manner as the nutrient and pyramid variables using amounts based on the US Department of Agriculture's updated version of the Pyramid Servings Database (PSD). The MPED variables align with the 2005 Dietary Guidelines for Americans and USDA's 2005 Food Guidance System, MyPyramid.

The major difference between the MPED and the PSD is that the units of the variables are now "ounce equivalents" and "cup equivalents," rather than "servings." Additionally, MPED provides four new variables (oils, solid fat, high omega 3 fish, low omega 3 fish) and incorporates improvements regarding how some ingredients and foods are classified.

See Appendix: Nutrients (DQX)

See Appendix: Pyramid (DQX)

Appendix 9: Grams (DQX)

Appendix 9: Grams (DQX)

Gram variables were calculated for each line item's servings and serving sizes on pages 3-11 of the DQX. Grams were calculated by multiplying the frequency* by a gram amount which was dependent on the gender of the subject as well as the response to serving size, when applicable.

These gram amounts came from a database based on national dietary data (USDA's 1994-96 Continuing Survey of Food Intakes by Individuals [CSFII], available from the USDA Food Surveys Research Group), containing one record per line item, gender, and serving size (small, medium, large, or overall).

A few of the line items on the questionnaire were considered "mixed dishes", and for these items, a percentage of the gram amounts were counted towards red and total meat, as shown below:

Lasagna: 9%
Spaghetti, noodles, other pasta: 9%
Beef stew, pot pies: 24%

* NOTE: weekly frequencies were multiplied by a number of weeks according to the seasonality of the line item to obtain a yearly frequency. After multiplying by the gram amount, the result was then converted back to a daily amount by dividing by 365.25. The multipliers were as follows:

"In season" line items: 13 weeks
"Out of season" line items: 39 weeks
All other line items: 52 weeks

Appendix 10: Meat Cooking Gram Variables (DQX)

Appendix 10: Meat Cooking Gram Variables (DQX)

Cooking method and/or doneness questions were asked on pages 12 and 13 of the DQX for steak, hamburgers, chicken, pork chops, bacon, and sausage, and these responses were used to create gram variables by cooking method and doneness for these meats. Where responses were missing, the most common cooking method or doneness levels were used. Pork chops were assumed to be well done, and bacon and sausage pan-fried.

Appendix 11: Food Frequency Responses (DQX)

Appendix 11: Food Frequency Responses (DQX)

Frequency responses indicate how often the subject consumed a particular food without regard to portion size. Frequency responses on the questionnaire were converted to weekly frequencies using the multipliers below. The weekly frequency was then divided by 7 to get the daily frequency. The possible responses were different for foods and beverages, and also varied slightly between different versions of the questionnaire. All possible responses are included below:
