Appendix 2: Nutrients (DHQ)

The DHQ nutrient variables are calculated from the questionnaire responses by the DietCalc software, which takes into account food frequency, serving size, and other responses (e.g. How often were these soft-drinks diet or sugar free?) and uses these in conjunction with a nutrient database based on national dietary data (USDA's 1994-96 Continuing Survey of Food Intakes by Individuals [CSFII], available from the USDA Food Surveys Research Group, or the Nutrition Data Systems for Research (NDS-R) from the University of Minnesota, which has nutrient values not available from the USDA Survey Nutrient Database) to calculate the daily intake of all nutrients in the database.

The DHQ differs from the DQX in that the food frequency questions don't always match one-to-one with items in the nutrient database; in some cases modifying questions on the questionnaire determine what item or items in the database are used for calculating nutrient amounts. However, the basic process is the same – food frequencies are multiplied by nutrient amounts in the database which are based on gender and serving size, and the resulting nutrient amounts are summed across all foods to get a total daily value for each nutrient.

For seasonal food frequencies, the food frequency is first multiplied by a seasonality factor as shown below:

Summer, Winter: 0.333
Not summer or not winter (rest of year): 0.667
In season: 0.25
Out of season: 0.75

For more information about the DHQ nutrient database, go to http://riskfactor.cancer.gov/DHQ/database/index.html .
For a list of which nutrients were derived from the CSFII, and which were derived from the NDS-R, go to http://riskfactor.cancer.gov/DHQ/database/nutrient.html .

Total fat, saturated fat, monounsaturated fat, and polyunsaturated fat have all been broken down into plant and animal groups (with animal further subdivided into meat, fish, eggs, and dairy as well), based on percentages in a spreadsheet provided by NCI investigators.

Appendix 3: Caffeine (DHQ)

Servings, serving sizes, caffeination, and diet questions were asked for soda, coffee, and tea.   The variables that have been derived from these questions are listed below according to the section where they can be found in the data dictionary.

Appendix 4: Flavonoids

Appendix 4: Flavonoids

Flavonoid and isoflavonoid variables are all mg/day. These flavonoid variables are "50%" variables, meaning that, for the purpose of deriving the nutrient database values, amounts for processed foods were assumed to be 50% of the raw food or foods. This was done to account for flavonoid losses due to processing.

See Appendix: Nutrients (DHQ) for more details regarding the calculations.

Appendix 5: Glycemic Index and Glycemic Load (DHQ)

<div style="background:#cccccc">Appendix 5: Glycemic Index and Glycemic Load (DHQ)</div>

Glycemic load is defined as the grams of available carbohydrate in the food multiplied by the food's glycemic index / 100.   The glycemic load was calculated in the same way as other Nutrients that is, the nutrient database contained an amount for each line item based on gender and serving size where applicable. This amount was multiplied by the frequency with which the subject reported consuming the item, and the glycemic load for all items was added together and converted to a total daily value. See Appendix: Nutrients (DHQ) for more details.

The glycemic index for each subject was calculated as a weighted average of the foods they ate by multiplying the subject's daily glycemic load by 100 and dividing by their daily "available" carbohydrate consumption. Available carbohydrates were defined as total carbohydrates – total dietary fiber (dt_fiber_csfii_dhq was used for this purpose).

Appendix 6: Pyramid (DHQ)

The DHQ pyramid serving variables are calculated in the same manner as the nutrient variables using amounts based on the US Department of Agriculture's pyramid servings, which are stored in the same gender and serving size-specific database as the nutrients. These variables represent standardized servings of food groups from all sources. See Appendix: Nutrients (DHQ) for more details regarding the calculations.

For additional information regarding the DHQ pyramid food groups, go to http://riskfactor.cancer.gov/DHQ/database/pyramid.html .

Appendix 7: MPED (DHQ)

MPED (My Pyramid Equivalents Database) variables were calculated in the same manner as the nutrient and pyramid variables using amounts based on the US Department of Agriculture's updated version of the Pyramid Servings Database (PSD). The MPED variables align with the 2005 Dietary Guidelines for Americans and USDA's 2005 Food Guidance System, MyPyramid.

The major difference between the MPED and the PSD is that the units of the variables are now "ounce equivalents" and "cup equivalents," rather than "servings."   Additionally, MPED provides four new variables (oils, solid fat, high omega 3 fish, low omega 3 fish) and incorporates improvements regarding how some ingredients and foods are classified.

See Appendix: Nutrients (DHQ)
See Appendix: Pyramid (DHQ)

Appendix 8: Grams (DHQ)

The DHQ gram variables are calculated using the detailed analysis file output by DietCalc, which lists the daily gram amounts for each food and question, as calculated by DietCalc from the coded responses to each food frequency and serving size question. In some cases more than one question contributed to the gram amount for a food, so the variables were calculated by summing the gram amounts by food for each subject.

DietCalc determines the gram amounts by gender and serving size (small, medium, large, or overall) using a nutrient database based on national dietary data (USDA's 1994-96 Continuing Survey of Food Intakes by Individuals [CSFII], available from the USDA Food Surveys Research Group, or the Nutrition Data Systems for Research (NDS-R) from the University of Minnesota, which has nutrient values not available from the USDA Survey Nutrient Database).

The meat group variables g_redmt_dhq and g_whitemt_dhq simply sum up the gram amounts for red meat and white meat (chicken, poultry, and fish, including shellfish, plus a percentage of lowfat sausage and hotdogs), respectively. A few of the items on the questionnaire were considered "mixed dishes", and for these items, a percentage of the gram amounts were counted towards total meat and either red or white meat, as shown below:

Chili: 20.9% (red)
Lasagna: 10.3% (red)
Pizza w/ meat: 15.6% (red)
Pasta w/ meat sauce: 9% (red)
Ground beef mixtures such as meatballs or meat loaf: 76.6% (red)
Beef stews/pot pies: 25.5% (red)
Lowfat sausage: 50% (white)
Lowfat hot dogs: 50% (white)

Appendix 9: Meat Cooking Gram Variables (DHQ)

Appendix 9: Meat Cooking Gram Variables (DHQ)

Cooking method and/or doneness questions were asked on pages 12 and 13 of the DQX for steak, hamburgers, chicken, pork chops, bacon, and sausage, and these responses were used to create gram variables by cooking method and doneness for these meats. Where responses were missing, the most common cooking method or doneness levels were used. Pork chops were assumed to be well done, and bacon and sausage pan-fried.

Appendix 10: Food Frequency Responses (DHQ)

Appendix 10: Food Frequency Responses (DHQ)

Frequency responses indicate how often the subject consumed a particular food without regard to portion size.   The DHQ food frequency variables are calculated using the detailed analysis file output by DietCalc, which lists the daily frequency for each food and question, as calculated by DietCalc from the coded responses to each food frequency question. In some cases more than one question contributed to the daily frequency for a food, so the variables were calculated by summing the daily frequencies by food for each subject.
